Governance

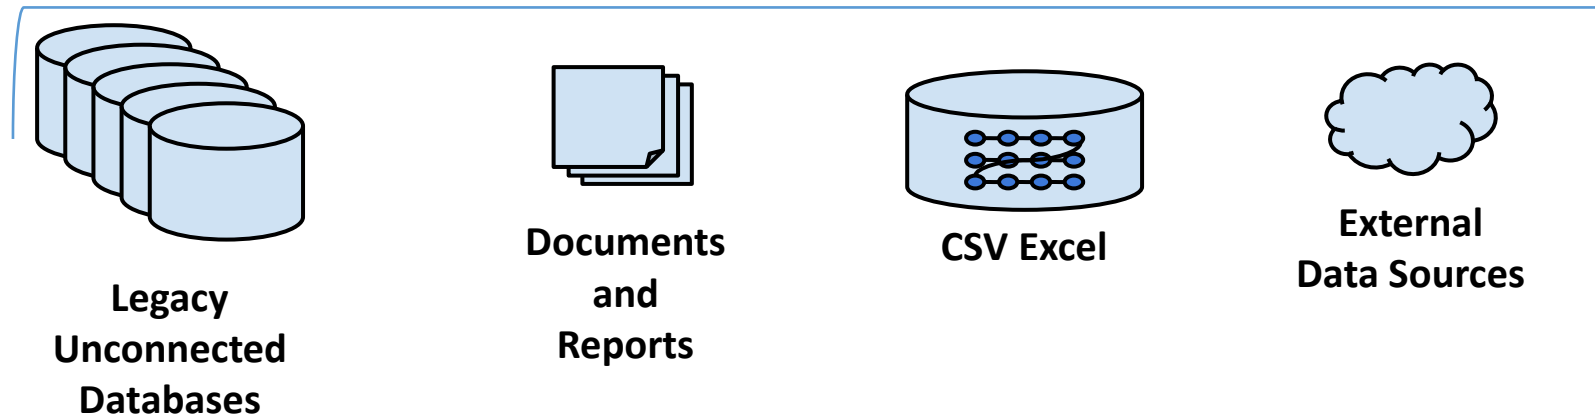

ERA's Mission:

Make the railway system work better for society

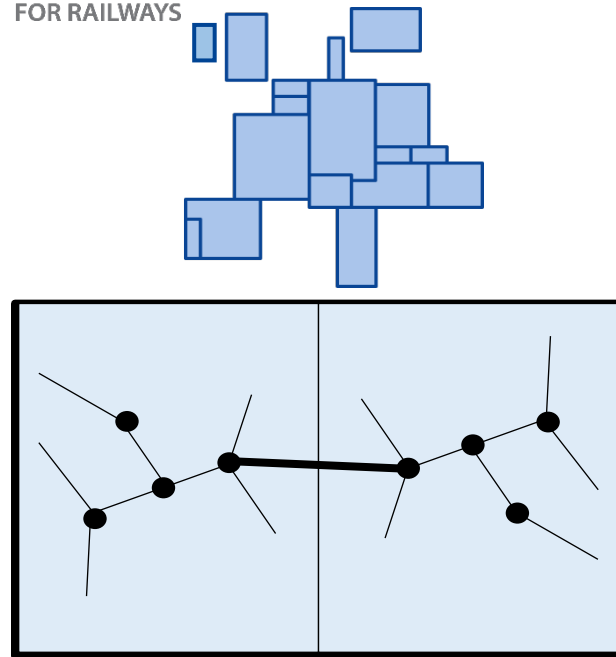

- Contribute to the effective functioning of a Single European Railway Area without frontiers
- Areas : safety and interoperability

Evergrowing DATA ecosystem

Data are key in optimizing Railway operations in SERA

Single Rail Area - harmonised specification
Operators work seamlessly across borders
(in competition)

+

Connected Data

=

Go everywhere operators and rail vehicles - Single Safety Certification and EU wide Authorisation (4 RP)

True harmonisation of operations at EU level - **OPE TSI 2019 revision** and elimination of national rules

Increased interoperability and ERTMS game changers - TSI 2022 revision

Make the railway system work better for a **digital society** - Agency as the authority for sectorial reference data

Agency's digital vision : from siloed to connected data

Application Centric

Before 2019

ERA Hosting siloed Registers, Reports, Safety Performance indicators

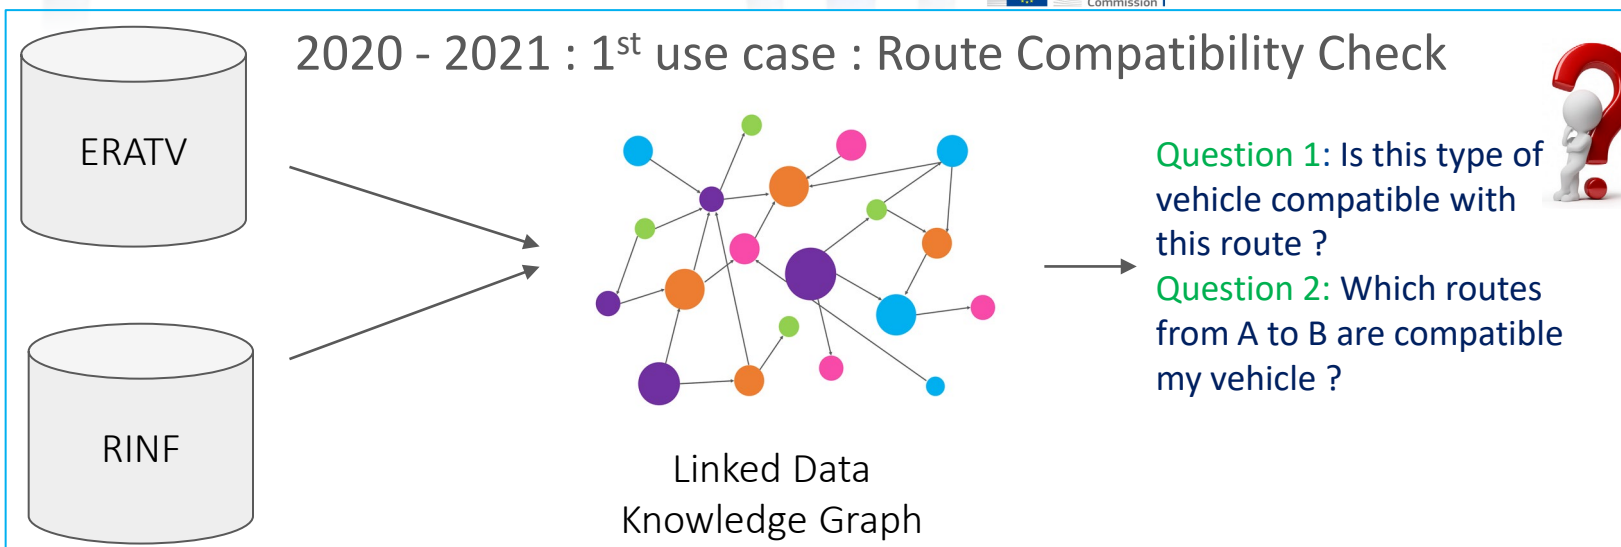

2020 - 2021

Data & User Centric

Data HUB
Governance of Reference Data
Facilitating Data Exchange of those key datasets
+
Monitoring Data Exchange

The Route Compatibility Check use case

European Register of Authorised Types of Vehicles (ERATV)

Types of railway vehicles authorised by ERA or the Member States

Application

Data Base

Data models are hidden in the application layer

Application

Data Base

Register of Infrastructure (RINF)

Register of infrastructure, stating the values of the network parameters of each subsystem or part subsystem concerned

Business value
Provider interest on sharing the data once and in a re-usable manner (once only principle)

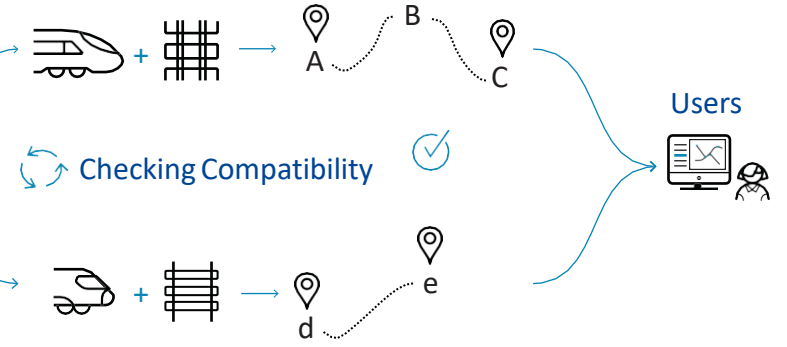

ERA Knowledge Graph

First step to extract "operational" value from ERA Registers

Route Compatibility Check

Find and analyse the information for the network topology and the vehicles...
...to automatically expose all the potential routes where a type of vehicle is technically compatible and able to run

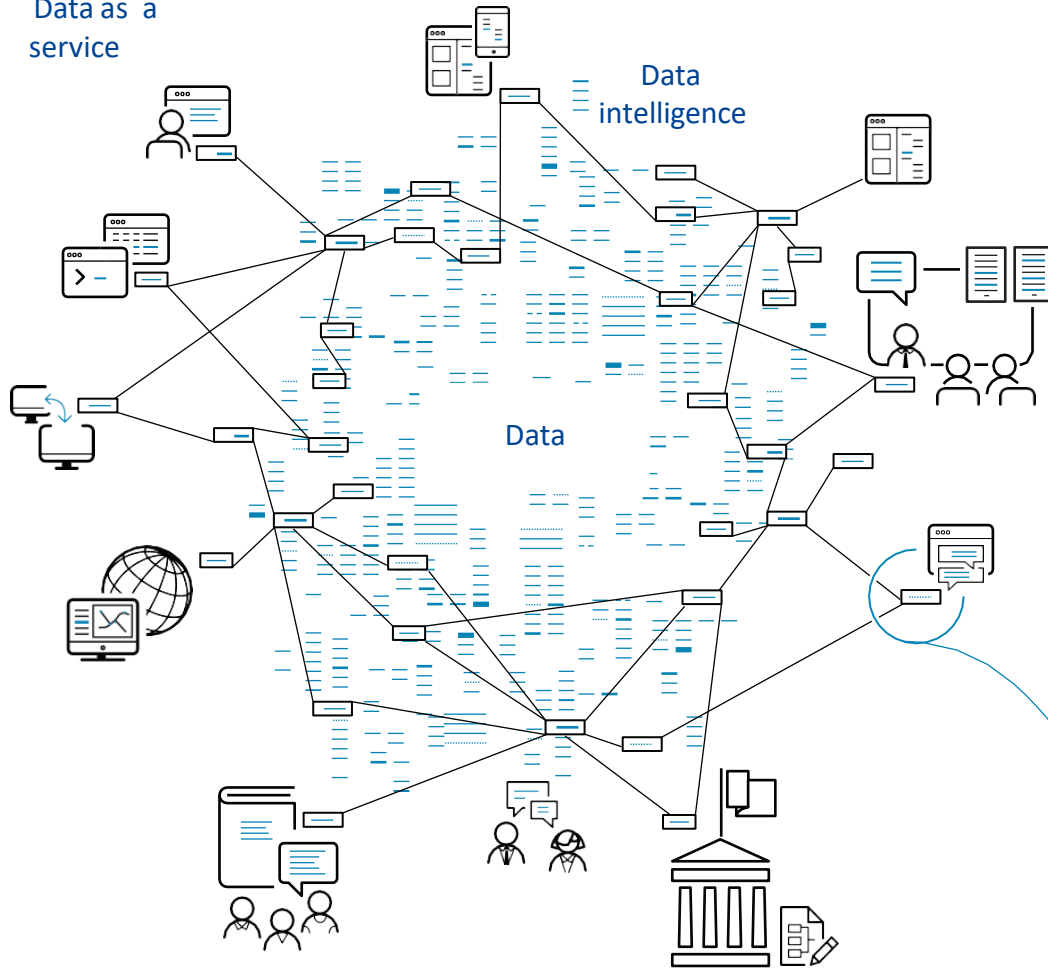

The tool provides support for the planning activity within the operational railway cycle via a web app, a simple user interface consuming the data of a knowledge graph

ERA route towards a data driven and data centric organisation

Data Centric Organization

Data as a service

Ontology

22 classes

318 properties

Reference Data = Controlled vocabulary

54 SKOS managed taxonomies

Knowledge Graph + query services

~26 millions triples

Route Compatibility Check app

To be released SOON

Web of data
not web of documents URI
granularity

New queries are made possible
(federated queries)

New use cases for the Agency

➤ Add new data sets (internal)

Link to external databases

➤ Add new data sets (external)

Sector to find new use cases

RCC overview -IM perspective

ERA Webinar : European Data on Rails

Date: October 28th, 2021

Hans SCHMIDT - EIM WG Rolling Stock

The purpose of this presentation is to provide the sector with a big picture of the current **RCC status** from **Infrastructure Managers'** perspective.

EIM WG Rolling Stock:

Active participants IMs from:

Belgium, Finland, France, The Netherlands, Norway and Sweden

Focused on European developments:

Vehicle authorisation process, TSI Loc&Pas/WAG and RCC

RCC Process currently taking place

- In theory, the process is applied according to the regulations in force.
- In reality, each Member State is at a different stage concerning the RCC process.
- IMs, in general, **do not have insight into how RUs apply the RCC procedure** and how many **real/complete** route compatibility checks have been done in the parameters of their network.
- IMs are currently continuing their efforts to **complete missing data in RINF**.
- IMs are **taking feedback from users** in case **irregularities** are detected.

RCC Process – Changes introduced post 4th Railway Package

Main changes and ambiguities:

- Roles: have been **well defined**.
- Tasks (attributed to each role): are still having **clarifications** being made/discussed.
- Tools: **have been improved** meanwhile **ambiguities in interpretations** of content/parameters, interfaces and juridical status exists.
- Processes: work has been done to **better define them**.
But **not defined/ambiguities in handling** for when comparing registers is **not sufficient** and more thorough control is required.

Situation IM France differs from other IMs:

- Responsibility for RCC was at IM France before, so transition to RU needed.
- IM France therefore ahead in guiding information/training on RCC and RINF.

Challenge to perform RCC with a crossborder/international scope

- Multiple interpretations to multiple items have been found. This is a challenge since it takes time and resources to find a common understanding.
- Up until recently there was no specific group to talk about the technical aspect of RCC.
- The groups to approach RCC process technical issues are more oriented in data science (IT mindset) concerning RCC.
- Arbitration is needed to provide the correct answer on a difference of opinions.
- Accountability concerning the quality of the data in ERATV and RINF is an issue.

IMs continue their efforts to accomplish a **harmonized interpretation or common understanding** of the definitions of the items/processes established for RCC.

Opportunities/Challenges from an IM perspective.

Opportunities:

- Accessible data facilitates **benchmarking**.
- Having the data accessible allows to have a **direct view** of how other IMs are working.

Challenges:

- Data **quality/accountability**.
- Arbitration when there is a **difference of opinions**.
- **Objective** cross examination/verification if data provided complies with data defined.

An opportunity for the future is to make an effort to extend the current **working group to treat business cases** for RCC, ERATV and RINF to **more concerning the technical operations perspective** of RCC.

Any Questions?
